

Reflection on the CRISPR powers and limitations

As a closing exercise we propose students write an essay on CRISPR powers and limitations. During this course, students learnt about the scientific basis and practical procedures of gene editing using CRISPR, while exploring speculative scenarios and creative avenues. In their projects they were confronted with technical challenges, and probably both the massive amount of data and scientific information, and the inexistence of enough knowledge regarding certain subjects.

In this essay we expect students to reflect on their journey, on what they learnt about CRISPR, and on how their perception of the subject changed, or not.
